Anti-inflammatory drugs

Drugs that reduces the sign of inflammation (redness, swelling, pain and fever) in the body. HOW?

Examples of INFLAMMATION

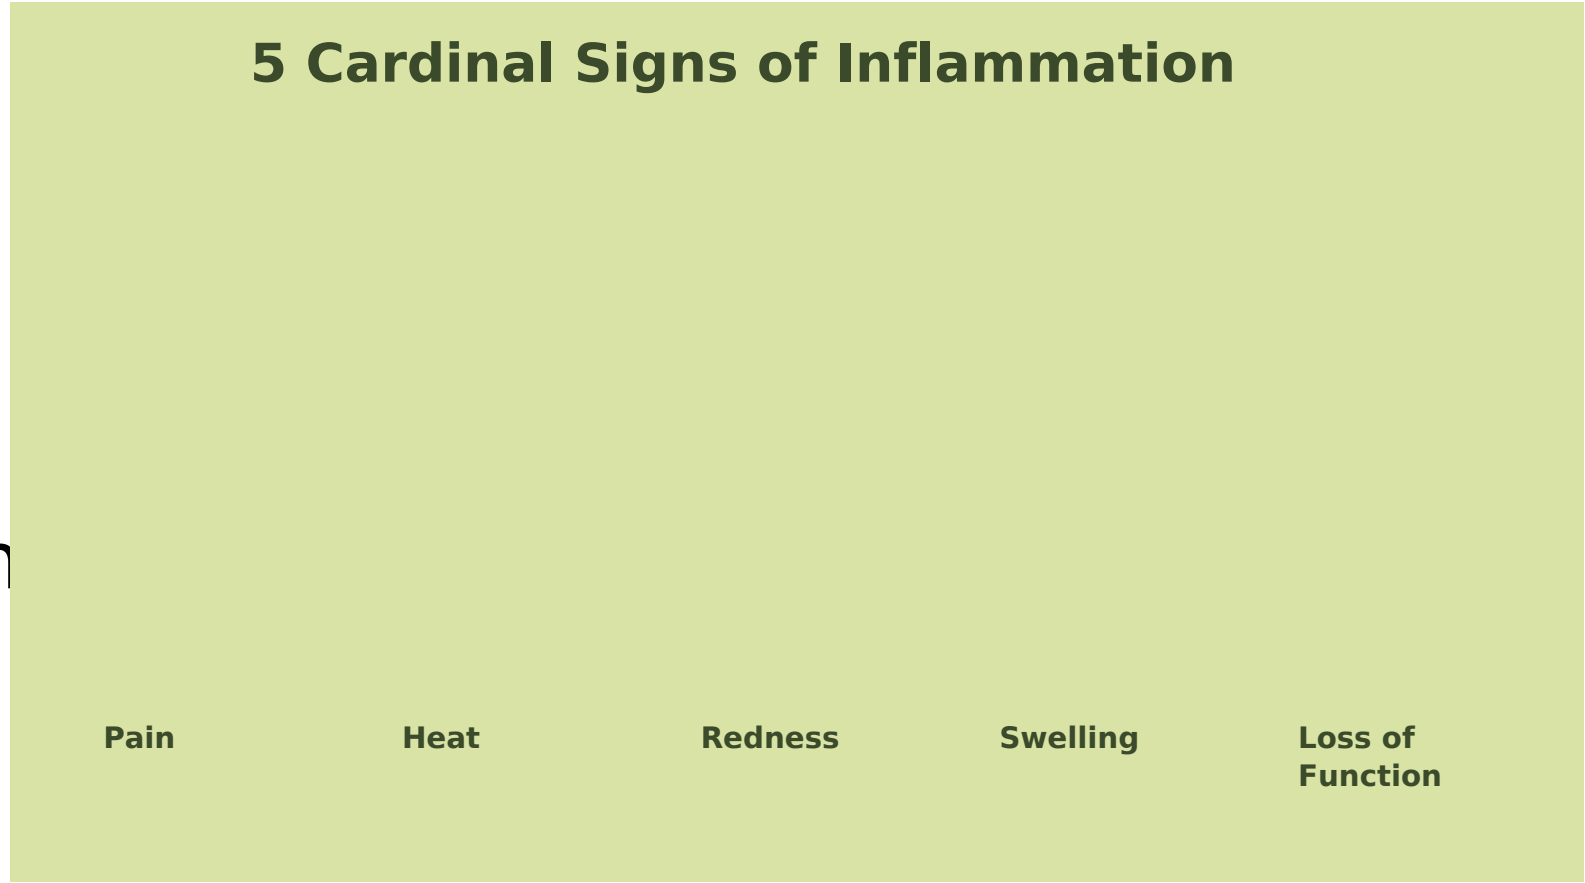
What are the anti-inflammatory drugs?

They are drugs or substances that reduce inflammation.

Inflammation

A normal response to tissue damage or infection and associated with:

- Pain
- Fever
- Swelling
- Redness
- Loss of function



8. Effect on Acid/base balance

1. At therapeutic to high dose (Low toxic dose)

- Stimulate respiratory center causing hyperventilation
- Decreses CO_2 (wash out)
- Increases HCO_3 $\longrightarrow$ $\uparrow$ PH causes (respiratory alkalosis)
- The kidney excrete bicarbonate HCO_3 to balance the pH).

2. Toxic doses:

- Excretion of HCO_3 (Metaboic acidosis)
- Inhibit respiratory center causing hypoventilation

causes retension of $\uparrow$ CO_2 and $\downarrow$ HCO_3 $\longrightarrow$ respiratory acidosis

2. Toxic doses:

- Inhibit respiratory center causing hypoventilation

  causes retension of $\uparrow CO_2$ and $\downarrow HCO_3 \rightarrow$ respiratory acidosis
